<h1>Payment and Email Sending Form</h1>
<form id="paymentForm" enctype="multipart/form-data">
<label for="walletDetails">Wallet Details: </label>
<input type="text" id="walletDetails" required/>
<br/>
<label for="emailSubject">Email Subject: </label>
<input type="text" id="emailSubject" required/>
<br/>
<label for="emailBody">Email Body: </label>
<textarea id="emailBody" rows="4" required></textarea>
<br/>
<label for="attachment">Attachment: </label>
<input type="file" id="attachment"/>
<br/>
<input type="submit" value="Submit Payment and Send Email"/>
</form>
<br/>
<h2>Transaction and Email Sending Result:</h2>
<div id="result"></div>

```

```

<script>
const web3 = new Web3('<your_testnet_rpc_endpoint>');

const contractAddress = '<your_contract_address>';
const contractABI = <contract_abi>

const contract = new web3.eth.Contract(contractABI, contractAddress);

$('#paymentForm').submit(async function(event) {
event.preventDefault();

const walletDetails = $('#walletDetails').val();
const emailSubject = $('#emailSubject').val();
const emailBody = $('#emailBody').val();
const file = $('#attachment')[0].files[0];

```

```

try {
const accounts = await web3.eth.getAccounts();
const sender = accounts[0];

const transaction = await contract.methods.<your_method_name>(walletDetails, emailSubject,
emailBody).send({ from: sender, value: web3.utils.toWei('<your_payment_amount_ether>', 'ether')});

// Handle successful transaction

// Send email using SMTP (Add your own implementation using Python)
// Example code: $.post('/send_email', {emailRecipient: walletDetails, emailSubject: emailSubject,
emailBody: emailBody, attachment: file});

$('#result').text('Payment and email sent successfully!');
} catch (error) {
console.error('Error:', error);
$('#result').text('Error: ' + error.message);
}
});
</script>
</body>
</html>
...

```

In this example, you need to replace the following placeholders with your own values:

- ``<your_testnet_rpc_endpoint>``: Replace with the RPC endpoint of the Rootstock testnet you want to connect to.
- ``<your_contract_address>``: Replace with the address of your deployed Solidity contract.
- ``<contract_abi>``: Replace with the ABI (Application Binary Interface) of your contract.
- ``<your_method_name>``: Replace with the method name in your contract that initiates the payment and email sending process.
- ``<your_payment_amount_ether>``: Replace with the amount (in Ether) that needs to be paid.
- ``$.post('/send_email', ...)` : Replace this line with your own implementation to send the email using Python and the SMTP library.`

Remember to have a web server running to serve this HTML file, or you can use a local development server like Live Server extension in Visual Studio Code.

Please note that this is just a basic example, and you would need to implement the back-end and external dependencies (like SMTP) yourself.
